#### Overview of Financial System

Economics 301: Money and Banking

# Goals and Learning Outcomes

- Goals:
  - Learn to compute present values, rates of return, rates of return.
- Learning Outcomes:
  - LO3: Predict changes in interest rates using fundamental economic theories including present value calculations, behavior towards risk, and supply and demand models of money and bond markets.

# Goals and Learning Outcomes

- Goals:
  - Learn to compute present values, rates of return, rates of return.
- Learning Outcomes:
  - LO3: Predict changes in interest rates using fundamental economic theories including present value calculations, behavior towards risk, and supply and demand models of money and bond markets.

• Read Mishkin, Chapter 4.

- Cash flows: size and timing of payments made for various debt instruments.
- Present value: aka present discounted value, discounts payments made in the future to a current date equivalent.
- Present value depends on assumption for interest rate.
  - Higher interest rates higher degree of discount

- Present value depends on assumption for interest rate.
  - Higher interest rates higher degree of discount.

- Simple loan: lender provides funds to borrower, borrower pays back principal and interest at maturity date.
- Suppose interest rate is 5% (denote with i), simple loan of \$100 (denote with P).
- Balance (denote with A) with a one year maturity: •  $A_1 = P(1+i) = \$100(1+0.05) = \$105$ .
- Let it ride for another year...
  - $A_2 = A_1(1+i) = \$105(1+0.05) = \$110.25$ •  $A_2 = P(1+i)(1+i) = P(1+i)^2 = \$100(1+0.05)^2 = \$110.25$
- At the end of n years, we have
  - $A_n = P(1+i)^n$

- Simple loan: lender provides funds to borrower, borrower pays back principal and interest at maturity date.
- Suppose interest rate is 5% (denote with i), simple loan of \$100 (denote with P).
- Balance (denote with A) with a one year maturity: •  $A_1 = P(1+i) = \$100(1+0.05) = \$105$ .
- Let it ride for another year... •  $A_2 = A_1(1+i) = \$105(1+0.05) = \$110.25$ •  $A_2 = P(1+i)(1+i) = P(1+i)^2 = \$100(1+0.05)^2 = \$110.25$
- At the end of *n* years, we have  $A = P(1 + i)^n$

- Simple loan: lender provides funds to borrower, borrower pays back principal and interest at maturity date.
- Suppose interest rate is 5% (denote with i), simple loan of \$100 (denote with P).
- Balance (denote with A) with a one year maturity:

• 
$$A_1 = P(1+i) = \$100(1+0.05) = \$105.$$

- Let it ride for another year...
  - $A_2 = A_1(1+i) = \$105(1+0.05) = \$110.25$
  - $A_2 = P(1+i)(1+i) = P(1+i)^2 = \$100(1+0.05)^2 = \$110.25$
- At the end of n years, we have
  - $A_n = P(1+i)^n$ .

#### • Simple loan.

- Fixed-payment loan: borrower makes a fixed payment (that includes interest and principal) each period until maturity date.
- Coupon bond: borrower pays fixed interest payments (coupon payments) until maturity date, pays face value at maturity.
  - Coupon rate: dollar amount of coupon payments as a percentage of face value. Related to, but not exactly an interest rate.
- Discount bond: bought at a price below its face value, makes no payments until maturity date, at which time pays face value.

- Simple loan.
- Fixed-payment loan: borrower makes a fixed payment (that includes interest and principal) each period until maturity date.

- **Compounded interest:** when interest payments are made multiple times in a given period.
- Compounded annually: full interest payment paid out once per year.
- Compounded quarterly: payment for 1/4 of interest rate made 4 times per year.
- Compounded monthly: payment for 1/12 of interest rate made 12 times per year.
- Compounded daily: payment for 1/365 of interest rate made 365 times per year.
- Compounded continuously: interest payments constantly made. Occurs in nature.

# Present Value Computations

• The geometric series is a useful mathematical tool in PV computations: If  $\beta \in (0,1)$ , then,

$$\frac{1}{1-\beta} = 1 + \beta + \beta^2 + \beta^3 + \beta^4 + \dots$$

Extensions:

$$\frac{\beta^{(T+1)}}{1-\beta} = \beta^{(T+1)} + \beta^{(T+2)} + \beta^{(T+3)} + \beta^{(T+4)} + \dots$$

Subtract the second equation from the first

$$\frac{1 - \beta^{T+1}}{1 - \beta} = 1 + \beta + \beta^2 + \beta^3 + \dots + \beta^T$$

• Used in present values:  $\beta = \frac{1}{1+i}$  which is between 0 and 1 for positive interest rates.

- Example: yield to maturity for a simple loan.
  - PV = Cash borrowed = \$200.
  - CF = Cash flow = payment received after n = 5 years \$280.51.

$$PV = \frac{CF}{(1+i)^n} \rightarrow 200 = \frac{280.51}{(1+i)^5}$$

$$(1+i)^5 = \frac{280.51}{200} \rightarrow 1+i = \left(\frac{280.51}{200}\right)^{\frac{1}{5}}$$

$$1+i=1.07 \rightarrow i=7\%$$

- Yield to maturity: the annual interest rate that equates the present value of cash flow of payments received from a debt instrument with its current day value.
- Example: yield to maturity for a simple loan.
  - PV = Cash borrowed = \$200.
  - CF = Cash flow = payment received after n = 5 years \$280.51.

$$PV = \frac{CF}{(1+i)^n} \rightarrow 200 = \frac{280.51}{(1+i)^5}$$

$$(1+i)^5 = \frac{280.51}{200} \rightarrow 1+i = \left(\frac{280.51}{200}\right)^{\frac{1}{5}}$$

$$1+i=1.07 \rightarrow i=7\%$$

- Present value of a coupon bond for,
  - Coupon payment = CF.
  - Face value = F.
  - Years to maturity = T.

$$PV = \frac{CF}{(1+i)} + \frac{CF}{(1+i)^2} + \dots + \frac{CF}{(1+i)^T} + \frac{F}{(1+i)^T}$$
$$PV = \sum_{t=1}^{T} \frac{CF}{(1+i)^t} + \frac{F}{(1+i)^T}$$

- Present value of a coupon bond for,
  - Coupon payment = CF.
  - Face value = F.
  - Years to maturity = T.

$$PV = \frac{CF}{(1+i)} + \frac{CF}{(1+i)^2} + \dots + \frac{CF}{(1+i)^T} + \frac{F}{(1+i)^T}$$

$$PV = \sum_{t=1}^{T} \frac{CF}{(1+i)^t} + \frac{F}{(1+i)^T}$$

  - Years to maturity = T.

$$PV = \frac{CF}{(1+i)} + \frac{CF}{(1+i)^2} + \dots + \frac{CF}{(1+i)^T} + \frac{F}{(1+i)^T}$$

$$PV = \sum_{t=1}^{T} \frac{CF}{(1+i)^t} + \frac{F}{(1+i)^T}$$

- Rate of return: the total benefits received from holding a security, expressed as a percentage of purchase price.
- Rate of return includes interest payments plus capital gains.
- Rate of return for holding a bond from time t to t+1 is,

$$R = \frac{CF + P_{t+1} - P_t}{P_t}$$

- R: rate of return
- $P_t$ : price of bond at time t.
- Can also express rate of return as the sum, R = i + g, where,

rate of capital gain 
$$=g=rac{P_{t+1}-P_t}{P_t}$$

$$interest rate = i = \frac{CF}{P_t}$$

- Suppose a debt instrument is held for one year that is,
  - purchased for \$1,500,
  - makes a single interest payment of \$100,
  - sold for \$1,600.
- What is the interest rate, rate of capital gain, rate of return?
- Suppose instead the sale price is \$1,400. What is the interest rate, rate of capital gain, rate of return?

- Long-term debt instruments have a high degree of interest rate risk.
- interest rate risk: changes in interest rates over the life of the debt instrument influence the secondary market price of the bond, influencing capital gains and therefore rate of return.
- Prices and returns for long-term bonds are more volatile than short-term bonds.
- Interest payments are therefore typically higher for long-term bonds.

- Long-term debt instruments have a high degree of interest rate risk.
