Money Supply Process

Economics 301: Money and Banking

1

1.1 Goals

Goals and Learning Outcomes

- Goals:

  - Understand balance sheets of Federal Reserve system and banking system.
  - Understand how money is created and multiplied.
  - Understand determinants of money supply.

- Learning Outcomes:

  - LO4: Explain the structure of the Federal Reserve System and the mechanisms in which it controls the money supply.

1.2 Reading

Reading

- Read Mishkin, Chapter 13.

2 Balance Sheets

2.1 Federal Reserve System

Federal Reserve Balance Sheet

Federal Reserve System

Assets	Liabilities
Government securities	Currency in circulation
Discount loans	Reserves
Corporate securities	
Mortgage backed securities	

- Assets: securities purchased by the Federal Reserve.

- Fed began buying corporate and mortgage backed securities in response to latest financial crisis.

- Reserves:

  - Banks have accounts at the Fed in which they hold deposits to be used to meet their own depositors needs.
  - Reserves = Deposits of banks at Fed + currency physically held by banks in vaults.

2.2 Banking System

Banking System Balance Sheet

Banking System

Assets	Liabilities
Government securities	Checkable deposits
Personal/Corporate Loans	Other types of deposits
Loaned federal funds	Borrowed federal funds
Reserves	Discount Loans
Physical Collateral on Defaults	

2.3 Open Market Operations

Open Market Operations

- Monetary base = currency in circulation + total reserves in banking system (MB=C+R).

- Open market purchase of $100 in Treasury Bills from Banking system.

Banking System

Assets		Liabilities
Government Securities	-$100	
Reserves	+$100	

Federal Reserve System

Assets		Liabilities	
Government Securities	+$100	Reserves	+$100

Open Market Purchase from Public

- Open market purchase of $100 from non-bank public.

- Suppose public deposits $80 of proceeds in banks and holds $20 currency.

Non-bank Public

Assets		Liabilities
Government Securities	-$100	
Checkable Deposits	+$80	
Currency	+$20	

Open Market Purchase from Public (continued)

- Open market purchase of $100 from non-bank public.

- Suppose public deposits $80 of proceeds in banks and holds $20 currency.

Banking System

Assets		Liabilities	
Reserves	+$80	Checkable Deposits	+$80

Federal Reserve System

Assets		Liabilities	
Government Securities	+$100	Reserves	+$80
		Currency in circulation	+$20

2.4   Discount Loans

Discount Loan

- **Discount loan:** loan in which a bank or financial institution borrows funds directly from the Federal Reserve.

- Suppose Acme Bank makes a $200 discount loan.

Banking System

Assets		Liabilities	
Reserves	+$200	Discount Loans	+$200

Federal Reserve System

Assets		Liabilities	
Discount Loans	+$200	Reserves	+$200

3   Money Multiplier

3.1   Deposit Creation

Deposit Creation

- Suppose **required reserve ratio** is 5% and banks hold no excess reserves.

- Suppose Fed makes a $100 open market purchase of bonds.

- Increases banks' reserves by $100, they in turn loan full amount to non-bank public.

- Non-bank public borrows $100 and spends it.

- $100 expenditure becomes $100 income for others in non-bank public.

- Suppose non-bank public holds zero currency, puts full amount in checkable deposits.

Deposit Creation (continued)

- Banks deposits increase by $100.

- Put puts $(0.05)(\$100) = \$5$ in reserves (minimum required), loans out remaining $95.

- Non-bank public borrows $95, this becomes income for others, which ends up in deposits.

- Banks put $(0.05)(\$95) = \$4.75$ in reserves, loans out remaining $90.25.

- Non-bank public borrows $90.25, this becomes income for others, which ends up in deposits again.

- Banks put $(0.05)(\$90.25) = \$4.51$ in reserves, loans out remaining $85.74...

3.2 Algebraic Solution

Money Multiplier

- A single $100 open market purchase of bonds created an increase of deposits equal to...

$$\Delta D = \$100 + 95 + 90.25 + 85.74 + ...$$

- Let ΔR denote initial change in reserves ($100), r denote required reserve ratio.

$$\Delta D = \Delta R + (1-r)\Delta R + (1-r)^2\Delta R + (1-r)^3\Delta R + ...$$

- Can you simply this expression? How much larger is change in deposits compared to open market purchase?

Money Multiplier Algebra

- Required reserves = (required reserve ratio)(deposits).

- Recall, we assume Actual reserves = Required Reserves.

$$R = rD$$

$$D = \frac{1}{r}R$$

$$\Delta D = \frac{1}{r}\Delta R$$

- Money multiplier = $m = \frac{1}{r}$.

- Money Supply = (money multiplier) (monetary base).

3.3 General Money Multiplier

General Money Multiplier

- Suppose people do hold currency, banks hold excess reserves.

- Notation:

  - C: Currency holdings.
  - D: Deposits.
  - RR: Required reserves.
  - ER: Excess reserves.
  - R: Actual reserves.
  - MB: Monetary base.

- For simplicity, assume ratios of currency holdings and excess reserves are constant:

  - c = C/D = currency ratio.
  - e = ER/D = excess reserves ratio.

- Use MB = R+C and M1 = C+D to derive money multiplier.

4 Money Supply

4.1 Determinants

Determinants of Money Supply

- Monetary base is composed of,

  - Non-borrowed monetary base: reserves and currency that were not borrowed directly from Federal Reserve.
  - Borrowed reserves: reserves that were directly borrowed from Federal Reserve.

- Factors affecting money supply:

  - Open market operations (affect non-borrowed monetary base).
  - Changes in required reserve ratio.
  - Changes in banks desire to hold excess reserves.
  - Changes in consumers' desire to hold currency versus deposits.
  - Changes in borrowed reserves.

4.2   Endogenous Money Supply

Endogenous Money Supply

- Typical assumption: central bank exogenously influences money supply through open market operations.

- How might excess reserves be influenced by interest rate?

- For a given discount rate, how might borrowed reserves be influenced by interest rate?

5

5.1   Coming up...

Coming up...

- In-class exercise.

- Monetary Policy Tools (Chapter 14)
